From qubits to pbits in three dimensions

Conclusions

#### General context

A toy model: the toric code in two dimensions

Finite temperature behaviour thermal fragility in spite of gap "protection" classical origin of quantum topological information?

From qubits to pbits in three dimensions

Conclusions

・ロト・「聞・ 《聞・ 《聞・ 《日・

"A system is in a topological phase if, at <u>low temperatures</u>, <u>energies</u>, and <u>wavelengths</u>\*, all observable properties (e.g. correlation functions) are invariant under smooth deformations (diffeomorphisms) of the spacetime manifold in which the system lives."

(i.e., all observable properties are independent of the choice of spacetime coordinates).

[\*] "By 'at low temperatures, energies, and wavelengths', we mean that diffeomorphism invariance is only violated by terms which vanish as  $\sim \max\{e^{-\Delta/T}, e^{-|x|/\xi}\}$  for some non-zero energy gap  $\Delta$  and finite correlation length  $\xi$ ."

### How robust is really the topological protection?

Non locality  $\Rightarrow$  strong protection from zero-temperature perturbations (non-local tunneling events are suppressed exponentially in system size)

### How robust is really the topological protection?

Non locality  $\Rightarrow$  strong protection from zero-temperature perturbations (non-local tunneling events are suppressed exponentially in system size)

#### What about thermal fluctuations?

- above the energy barrier: no topological protection
- there is no local order parameter: 'ordinary' protection arguments (e.g., magnets) do *not* apply

Given a system described by the ground state density matrix  $\rho = |\Psi_0\rangle \langle \Psi_0|$ 

 $\rho_{\mathcal{A}} = \operatorname{Tr}_{\mathcal{B}} \rho$  $S_{\mathcal{A}} = -\operatorname{Tr} \left[\rho_{\mathcal{A}} \log \rho_{\mathcal{A}}\right]$  $= \alpha L - \gamma + \dots$ 

where  $\gamma > 0$  is a universal constant of global origin, dubbed the topological entropy (Kitaev, Preskill 2006, Levin, Wen 2006)

Levin, Wen 2006

The topological contribution  $\gamma$  can be obtained directly by choosing the following four bipartitions

and taking an appropriate linear combination

$$S_{ ext{topo}} \equiv \lim_{r, \mathcal{R} \to \infty} \left( -S_{1\mathcal{A}} + S_{2\mathcal{A}} + S_{3\mathcal{A}} - S_{4\mathcal{A}} \right) = 2\gamma$$

where each term is given by the Von Neumann (entanglement) entropy of the corresponding bipartition General context

## The toric code (I)

Kitaev 1997

where  $\lambda_{A},\;\lambda_{B}$  are real, positive parameters

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

# The toric code (I)

Kitaev 1997

 $[B_p, B_{p'}] = 0$   $[A_s, A_{s'}] = 0$   $[A_s, B_p] = 0$ 

One can diagonalise the Hamiltonian at the same time as the N-1 independent  $B_p$  operators, and N-1 independent  $A_s$  operators (N being the number of sites).

The ground state is 4-fold degenerate  $2^{2N-2(N-1)} = 4$ ,

 $\Rightarrow$  four topological sectors identified by the eigenvalues of the non-local operators

$$\Gamma_{\rm hor} = \prod_{i \in \gamma_{\rm hor}} \hat{\sigma}^z_i \quad \Gamma_{\rm vert} = \prod_{i \in \gamma_{\rm vert}} \hat{\sigma}^z_i$$

The ground state is 4-fold degenerate  $2^{2N-2(N-1)} = 4$ ,

 $\Rightarrow$  four topological sectors identified by the eigenvalues of the non-local operators

$$\begin{split} &\Gamma_{\rm hor} = \prod_{i \in \gamma_{\rm hor}} \hat{\sigma}_i^z \quad \Gamma_{\rm vert} = \prod_{i \in \gamma_{\rm vert}} \hat{\sigma}_i^z \\ &\mathcal{T}_{\rm hor} = \prod_{i \in \tau_{\rm hor}} \hat{\sigma}_i^x \quad \mathcal{T}_{\rm vert} = \prod_{i \in \tau_{\rm vert}} \hat{\sigma}_i^x \end{split}$$

From qubits to pbits in three dimensions

Conclusions

 $\rho(0) = |\Psi_0\rangle\langle\Psi_0| \longrightarrow \rho(T) = e^{-\beta H}/Z$ , yet one can obtain an exact expression for both  $S_A$  and  $S_{\text{topo}}$  CC + Chamon 2007

- ▶ at finite system size N and temperature T,  $S_{\text{topo}}$  is a function of  $N \ln[\tanh(\lambda_{A/B}/T)] \sim NT$ , and the  $N \to \infty$  and  $T \to 0$  limits do not commute:
  - if the thermodynamic limit is taken first, the topological entropy vanishes identically
  - if the zero temperature limit is taken first, we recover the known result  $S_{topo}(T = 0) = 2 \ln 2$

▲□▶ ▲□▶ ▲三▶ ▲三▶ ▲□ ● ● ●

order parameter to distinguish topological sectors:

at zero temperature 
$$T = 0$$
:  
 $\Gamma_0 = \left\langle \prod_{i \in \gamma} \hat{\sigma}_i^z \right\rangle_0 = \pm 1 \qquad \longrightarrow \qquad \Gamma(T) = \frac{1}{N_\gamma} \sum_{\{\gamma\}} \left\langle \prod_{i \in \gamma} \hat{\sigma}_i^z \right\rangle_T$   
independent of  $\gamma$

low energy defects:

plaquettes with  $B_p = -1$ 

- they appear in pairs
- they are deconfined

order parameter to distinguish topological sectors:

at zero temperature 
$$T = 0$$
:  
 $\Gamma_0 = \left\langle \prod_{i \in \gamma} \hat{\sigma}_i^z \right\rangle_0 = \pm 1 \qquad \longrightarrow \qquad \Gamma(T) = \frac{1}{N_\gamma} \sum_{\{\gamma\}} \left\langle \prod_{i \in \gamma} \hat{\sigma}_i^z \right\rangle_T$   
independent of  $\gamma$ 

at zero temperature 
$$T = 0$$
:  
 $M_0 = \langle \hat{\sigma}_i^z \rangle_0$   $\longrightarrow$  at finite temperature  $T$ :  
 $M(T) = \frac{1}{N} \sum_i \langle \hat{\sigma}_i^z \rangle_T$   
independent of  $i$ 

Thermal fluctuations act on individual spins, and one needs a finite density of them to affect the order parameter, which is therefore exponentially protected:  $\delta M \sim e^{-\Delta/T}$ 

### **Further considerations**

in the limit of λ<sub>B</sub> → ∞, λ<sub>A</sub> → 0 (λ<sub>B</sub> → 0, λ<sub>A</sub> → ∞), half of the topological entropy is preserved at finite *T*, and the system becomes a classical hard-constrained model ⇒ classical topological order

### **Further considerations**

- in the limit of λ<sub>B</sub> → ∞, λ<sub>A</sub> → 0 (λ<sub>B</sub> → 0, λ<sub>A</sub> → ∞), half of the topological entropy is preserved at finite *T*, and the system becomes a classical hard-constrained model ⇒ classical topological order
   CC + Chamon 2006
- the two contributions in the Hamiltonian (λ<sub>A</sub> and λ<sub>B</sub>) are in fact additive:

$$\begin{split} S_{\mathcal{A}}(T) &= S_{\mathcal{A}}^{(P)}(T/\lambda_B) + S_{\mathcal{A}}^{(S)}(T/\lambda_A) \\ S_{\text{topo}} &= S_{\text{topo}}^{(P)}(T/\lambda_B) + S_{\text{topo}}^{(S)}(T/\lambda_A) \end{split}$$

The non-vanishing quantum topological entropy arises from the plaquette and star terms in the Hamiltonian as two equal and *independent* (i.e., classical) contributions

### Conclusions from the 2D toric code

- topological order is fragile as compared to Landau-Ginzburg ordered systems with a gap
- ► in experiments, larger systems give higher topological quantum protection, but require T ~ 1/ ln N to be safe from thermal fluctuations

◆□▶ ◆□▶ ◆三▶ ◆三▶ →三 ● ● ●

### Conclusions from the 2D toric code

- topological order is fragile as compared to Landau-Ginzburg ordered systems with a gap
- ► in experiments, larger systems give higher topological quantum protection, but require *T* ~ 1/ ln *N* to be safe from thermal fluctuations

- the topological nature of this model has a classical origin
- quantum mechanics arises from the ability to create coherent superpositions

General context

A toy model: the toric code in two dimensions

Finite temperature behaviour thermal fragility in spite of gap "protection" classical origin of quantum topological information?

From qubits to pbits in three dimensions

Conclusions

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○三 ○○○

 on a simple cubic lattice, the plaquette operators remain planar (4-spin) terms, but the star operators become three-dimensional (6-spin) terms

 $H = -\lambda_A \sum_{s} \prod_{i \in s} \hat{\sigma}_i^x - \lambda_B \sum_{p} \prod_{i \in p} \hat{\sigma}_i^z$ 

# Membranes vs Loops (I)

- on a simple cubic lattice, the plaquette operators remain planar (4-spin) terms, but the star operators become three-dimensional (6-spin) terms
- the dual loop structure is replaced by closed membranes on the dual lattice

# Membranes vs Loops (II)

- on a simple cubic lattice, the plaquette operators remain planar (4-spin) terms, but the star operators become three-dimensional (6-spin) terms
- the dual loop structure is replaced by closed membranes on the dual lattice
- non-local operators distinguishing the different sectors are winding loops and winding membranes

fragile

### Finite temperature behavior

The two contributions ( $\lambda_A$  and  $\lambda_B$ ) are again additive:

$$S_{\mathcal{A}}(T) = S_{\mathcal{A}}^{(P)}(T/\lambda_B) + S_{\mathcal{A}}^{(S)}(T/\lambda_A)$$

$$\Downarrow$$

Classical origin of topological information is confirmed (no need for hard constraints in 3D)

The quantum topological information becomes probabilistic (classical) topological information at finite temperature:

- the loop sectors are still well defined
- ► loss of membrane contribution ⇒ loss of coherence within each sector

$$\begin{split} |\Psi(T=0)\rangle &= \psi_1 \sum_{\alpha \in 1} |\alpha\rangle + \psi_2 \sum_{\alpha' \in 2} |\alpha'\rangle + \dots \\ T \neq 0 : \qquad \begin{cases} \mathcal{P}_1(T) = |\psi_1|^2 \\ \mathcal{P}_2(T) = |\psi_2|^2 \\ \dots \end{cases} \end{split}$$

General context

A toy model: the toric code in two dimensions

Finite temperature behaviour thermal fragility in spite of gap "protection" classical origin of quantum topological information?

From qubits to pbits in three dimensions

#### Conclusions

# Conclusions

- ► quantum topological order is proteced (e<sup>-Δ/T</sup>) from thermal fluctuations by the presence of a finite gap...
- but the nature of the protection is radically different from locally ordered systems

# Conclusions

- ► quantum topological order is proteced (e<sup>-Δ/T</sup>) from thermal fluctuations by the presence of a finite gap...
- but the nature of the protection is radically different from locally ordered systems
- ▶ in particular, the protection gets weaker for larger systems!
- the topological nature of these quantum systems can be interpreted as the result of classical topological structures
- the quantum nature originates from the ability to create coherent superpositions

Can we use our intuition on classical systems to engineer / investigate new classes of quantum topologically ordered systems?

What about quantum Hall states and other topologically ordered systems in the continuum?
