

Design principles of Biological Circuits

Uri Alon

Departments of Molecular Cell Biology and Physics of Complex Systems, Weizmann Institute of Science, Rehovot, Israel

Networks of biological interactions are exceedingly complex. One source of hope for understanding them is to identify recurring circuit elements- network motifs- that have autonomous function, and from whom the larger network is constructed. This approach has been quite successful over the last decade, especially in identifying network motifs in transcription networks and in protein circuitry. This talk will discuss emerging design principles that unify aspects of recurring biological circuitry..
